RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 48 pages. Dimensions: 9.4in. x 7.2in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1921 Excerpt: . . . the same sources of error. It nicely fits their scheme of blood analysis but as an individual determination it requires more time and attention than the picric acid method. They have recently introduced certain improvements. 31 A year ago Morgulis and Jahr²¹ offered certain criticisms of the Lewis-Benedict method, directed especially to the influence of creatinine. They stated: It is probable, therefore, that the Lewis-Benedict method is applicable to normal bloods when the creatinine concentration is about 1 to 3 mg. per 100 c. c. , but under pathologic conditions when the creatinine level may rise to 10 to 40 mg. per 100 c. c. , the sugar analysis by the Lewis-Benedict method loses its value as a quantitative procedure. Criticism was made of results obtained with either the original Lewis-Benedict method or our modification of it, although Morgulis and Jahr employed Benedict, s new picric acid sodium picrate reagent, ²² this being much more sensitive to creatinine than the picric acid alone, owing to the Table V Influence Of Creatinine On The Accuracy Of The Blood Sugar Estimation The colorimetric readings made at once (as soon as the solution had cooled), were made roughly. Since the sodium picramate color formed from glucose does not appreciably fade, we frequently make these readings on the next day. These second readings were made with considerable care. Readings calculated on the basis of the same color development for creatinine as sugar agree very well with these figures. The readings...
